

Intelligent Interactive Systems course 2018-2019

Format for project specifications

Project specifications (**max 2 pages, pdf format**) should be submitted on the Student Portal and include concrete specifications for:

1) Objectives for the project

Include here what you aim to achieve in the project, e.g. what are the main features of the system that you are going to build, what are the inputs, the outputs, etc.

2) Methods

Divide the project in small parts/tasks/objectives. For each of them describe the methodology you plan to use. You should be as specific as possible in what methods you plan to investigate. Discuss how you plan to evaluate the system.

3) Timeline for the project

Set a timeline for the whole project duration, from week 18 until week 22, including the main tasks you envision and related milestones. For defining the milestones, please read carefully the projects description document on the student portal (PROJECTS → Projects information and requirements → project-description2019.pdf) and make sure you align your milestones with what you are recommended to show at the planned feedback sessions.
